Abstract<br>Weather Data Compiled for Blackstone, Virginia: 1949-2001<br>W.M. Tilson, C. D. Teutsch, W. B. Wilkinson III<br>Southern Piedmont Agricultural Research and Extension Center

Weather data recorded in Nottoway County, Virginia between 1949 and 2001 are presented and summarized. Data were recorded at the Virginia Tech Southern Piedmont Agricultural Research and Extension Center, Camp Pickett, and the Blackstone Army Airfield. Values for minimum, maximum, and average air temperatures were averaged over the 53-year period and reported on a daily and monthly basis. Daily and monthly precipitation amounts are also reported. Tables for low temperature probabilities, degree unit, and chilling-hour information are presented. Finally, information on hurricane frequency and severity and snowfall amounts for the state of Virginia is included.

## Introduction:

Weather information is generally summarized on a 30-year basis, with information updated at 10-year intervals (keeping the summary to a thirty-year period by omitting older data in favor of newer data). Daily temperature means and extremes, and monthly rainfall amounts reflect this change, whereas the record high and low temperature information is retained. Further, official 30-year summaries are very specific in that the station must have been in continuous operation. Due to these constraints, "official" 30-year summaries are unavailable for the Blackstone area at this time.

For those who have requested weather data summaries, it is hoped that this bulletin may provide more immediate assistance. Current plans include the posting of data for the most current month with yearly summaries. New temperature records will be identified in bold type. Specific information is available in various formats depending on origin. Currently, additional information is being collected for daily relative humidity, wind speed and direction, and PAR (solar radiation).

## Materials and Methods:

The information contained in this document was compiled from data recorded at several locations from 1949 to the present. Official weather information for the Blackstone area began in May of 1945. The first weather station was at the Blackstone Army Air Field (BAAF) N037:05 latitude W077:57 longitude at elevation 446'. The station was closed at the end of July, and data collection began again in December 1972 at a new location, designated Camp Pickett (CP). This station, located at N037:02:12 W077:57:52 (approximately 5.5 miles further south) and at elevation 333' continues to operate at this time. The final location for data presented is VPI\&SU Southern Piedmont Agricultural Research and Extension Center (SPAREC) with continuous records beginning in 1977. The Southern Piedmont data collection area is approximately 0.4 miles north of the BAAF station, at a similar elevation.

Data presented in this document reflect records from BAAF (January 1949 to July 1972), CP (December 1972-December 1976), and SPAREC (January 1977 to December 2001). Data from BAAF and CP were obtained from the Office of the State Climatologist in a data base file format. SPAREC data from 1977 through March 1993 was transcribed from hand-written records collected by W. B. Wilkinson III and staff. Beginning in April of 1993, information was collected electronically by a weather station located near the SPAREC central offices.

Prior to April 1993, maximum and minimum temperatures were read from hygrothermograph charts to the nearest $0.5^{\circ} \mathrm{F}$ and average daily temperature was calculated as the average of the maximum and minimum recorded temperatures. Rainfall amounts were read five days per week from a gauge located in an enclosure adjacent to the field operations building. Subsequently, electronic stations collected temperatures at preset intervals throughout the day to the nearest $0.01^{\circ}$, and the average daily temperature became the average of all recorded readings. Rainfall data were recorded electronically at the same intervals with a tipping bucket gauge.

Summary data included in this bulletin were generated with the use of SAS System. Low temperature probabilities required the calculation of the mean Julian date of the threshold and its associated standard deviation. The mean date is the $50 \%$ threshold. Days were added or subtracted as appropriate by multiplying standard deviations by the associated normal probability value. Snowfall information was extracted from station climatologies linked to the Virginia State Climatology Office website (http://climate.virginia.edu). Hurricane data were obtained from a Unisys website (http://weather.unisys.com/hurricane/index.html).

## Results and Discussion:

In the construction of this document, several decisions were made. It is hoped that the informal format chosen will serve both the casual reader and professionals seeking reliable data. Missing data totaled approximately $0.6 \%$ from August through November of 1972. As stated, there were years of overlapping data available. It is believed that the records taken at Southern Piedmont Agricultural Research and Extension Center (SPAREC) more closely match data obtained at the Blackstone Army Air Field primarily due not only proximity but also similarity in elevation. Data collected at SPAREC were used instead of the data recorded at the Camp Pickett Station.

When comparing data from the Camp Pickett site and that collected at SPAREC, there was a very good correlation with daily maximum temperatures. Daily minimum temperatures were consistently lower at the CP station. Comparisons of SPAREC and BAAF 'freeze' probabilities with those of CP show a difference of 10 days or more with CP data indicating much cooler spring and fall average temperatures. Rainfall events correlated well, but the actual amounts of precipitation varied considerably, especially during highly localized summer events. The most striking example occurred in 1992 when yearly rainfall totals at CP were 8.5 inches greater than those recorded at SPAREC.

Currently, in addition to temperature and rainfall, records available from SPAREC include relative humidity, wind speed and direction, and photosynthetically active radiation. These data have been collected since April of 1993 but are not included in this document. Weather data are summarized monthly and annual reports are issued.

## Acknowledgements:

We are indebted to Steve Gawtry of the Virginia State Climatologist's Office in Charlottesville for his assistance in obtaining the government records at BAAF and Fort Pickett and for his assistance in calculations of low temperature probability data for our area. The suggestions and editorial advice of the faculty at the SPAREC, especially Dr. Carol Wilkinson, were invaluable in preparing this document.

## January

Average Temperature: $37.6^{\circ} \mathrm{F}$
Average Daily Minimum: $27.9^{\circ} \mathrm{F}$
Driest January: 0.60" (1981)
Record Low: - $8.0^{\circ} \mathrm{F}$ (1/21/85)
Highest Low Temperature: $63^{\circ} \mathrm{F}(1 / 07 / 98)$

Average Precipitation: 3.43"
Average Daily Maximum: $47.7^{\circ} \mathrm{F}$
Wettest January: 8.05" (1978)
Record High: $79{ }^{\circ} \mathrm{F}$ (1/02/52)
Lowest High Temperature: $10^{\circ} \mathrm{F}$ (1/10/82)

## July

Average Temperature: $77.4^{\circ} \mathrm{F}$
Average Daily Minimum: $67.1^{\circ} \mathrm{F}$
Driest July: 0.41" (1977)
Record Low: $48.0^{\circ} \mathrm{F}$ (7/02/75)
Highest Low Temperature: $80^{\circ} \mathrm{F}(7 / 23 / 91)$

Average Precipitation: 4.64"
Average Daily Maximum: $88.1^{\circ} \mathrm{F}$
Wettest July: 11.96" (1959)
Record High: $103.1^{\circ} \mathrm{F}$ (7/22/98)
Lowest High Temperature: $68^{\circ} \mathrm{F}$ (7/04/76)

Probability levels indicate that a minimum temperature below the threshold will occur on or after a given date with the stated frequency. For example, in the spring there is a $10 \%$ chance (one year in ten) that the minimum temperature of $28^{\circ}$ or less will occur on or after April $11^{\text {th }}$. The columns labeled earliest and latest are unusual years in which the threshold temperature occurred much earlier or later than normal (50\%). Be aware that temperatures of $36^{\circ}$ (measured at 5-6 feet above ground level) can result in a frost at ground level and in depressions.

To use these tables as a planting guide:
Suppose you are transplanting squash that may be damaged with temperatures of $36^{\circ}$ or less. Further, suppose that you want a good jump on the neighbors and are willing to accept the fact that the crop will survive only once in four years (25\%). Trace across at $36^{\circ}$ to the $25 \%$ column and find the planting date of April $17^{\text {th }}$.

# Degree Units to Selected Base Temperatures ( ${ }^{\circ} \mathbf{F}$ ) 

Growing Degree Units

| Base |  | $\underline{\text { Jan }}$ | $\underline{\text { Feb }}$ | $\underline{\text { Mar }}$ | $\underline{\text { Apr }}$ | $\underline{\text { May }}$ | $\underline{\text { Jun }}$ | $\underline{\text { Jul }}$ | $\underline{\text { Aug }}$ | $\underline{\text { Sep }}$ | $\underline{\text { Oct }}$ | $\underline{\text { Nov }}$ | $\underline{\text { Dec }}$ |

|  | Cumulative | 20 | 47 | 135 | 386 | 871 | 1571 | 2420 | 3205 | 3777 | 4059 | 4160 | 4191 |
| 55 | Monthly | 7 | 10 | 42 | 149 | 338 | 550 | 694 | 634 | 426 | 166 | 46 | 13 |
|  | Cumulative | 7 | 17 | 58 | 208 | 545 | 1095 | 1790 | 2424 | 2850 | 3016 | 3062 | 3075 |
| 60 | Monthly | 2 | 2 | 16 | 77 | 206 | 402 | 540 | 483 | 287 | 81 | 15 | 4 |
|  | Cumulative | 2 | 4 | 20 | 98 | 304 | 706 | 1246 | 1729 | 2016 | 2097 | 2112 | 2116 |

To use the table, determine the base unit appropriate for the plant or crop (fruit trees $=40^{\circ} \mathrm{F}$, cotton $=60^{\circ} \mathrm{F}$ ). This base is the minimum temperature needed for growth. Within plant type, different varieties require different accumulated heat units in order to reach maturity prior to low temperatures and diminished day lengths in autumn.

Degree units are calculated as [Average Daily Temperature - Base] for each day of the month. The sum of these values is the monthly total shown. Cumulative values are a running total for the season, $($ Jan $+\mathrm{Feb}+\ldots)$. Values less than zero do not count against the total. For degree hour estimates, multiply the values by 24 .

## Chilling Hours October 1st - May $15^{\text {th }}$

| Base |  | Oct | $\frac{\text { Nov }}{}$ | $\frac{\text { Dec }}{528}$ | $\frac{\text { Jan }}{619}$ | $\frac{\mathrm{Feb}}{422}$ | $\frac{\text { Mar }}{345}$ | $\frac{\text { Apr }}{53}$ | $\frac{\text { May }}{0}$ |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 45 | Monthly | 14 | 250 | 5217 |  |  |  |  |  |
|  | Cumulative | 14 | 264 | 792 | 1411 | 1833 | 2178 | 2131 | 2131 |

Chilling hour requirements for deciduous plants are available by species/variety. Chilling hours indicate the amount of cold needed by the plant when in its winter dormancy (rest) period in order to resume normal spring growth. Chilling hours are applicable to fruit, nut, and berry crops among others.

Chilling hours in a day can be no more than 24 (indicating 24 hours of temperatures below $45^{\circ}$ ). The numbers above are conservative. Since hourly data were unavailable until 1994, sums were calculated using only days when the maximum temperature was less than the base of $45^{\circ}$. Chilling hour data for the years 1994 through 2001 are available upon request, but is in general agreement with the data above.

## Hurricanes in Virginia

Hurricane Trivia:

1951-Present - In the past 50 years, only 33 hurricanes have had a significant impact on Virginia. Despite the potential for damaging winds and flooding, hurricanes and tropical storms are vital sources of water in late summer. Years when rainfall totals are well below normal are generally years when rainfall associated with tropical disturbances is absent. Historically, hurricanes were not named until 1953. All hurricane names were female until 1979 when male names were introduced. The Safir-Simpson scale (hurricanes categorized numerically by wind speed) was adopted in 1975. Some of the more significant hurricanes are noted below.

1954 - Virginia's first named hurricane and the latest in the season (Hazel - October $15^{\text {th }}$ ) Hurricane force damaging winds, but produced little rain in Blackstone.

1955 - Three storms recorded: Connie (8/12) 4.60", Diane (8/17) 4.40" and Ione (9/19) 3.16" boost August/September rain totals to 19 "

1959 - Cindy (7/13) : rainfall 3.99".

1960 - Donna (9/10) passes east drops 3.04" of rain over 3 days.
1969 - Camille is the only named Category 5 hurricane to hit U.S. In Virginia, Camille was only a tropical depression with winds at 25 mph . Severe flooding in the western portions of the state but rainfall in Blackstone was only 2.31 ".

1972 - Agnes' record 7.47" of rain caused severs flooding conditions in central Virginia.

1975 - Eloise (9/23) : 4.74"
1979 - David arrives September $4^{\text {th }}$ produces 4.45 " of rain.
1985- As in 1955 three hurricanes strike Virginia in a single year. Blackstone totals: Bob 1.95", Danny 3.10" and Juan 2.80". Juan "Killer Flood of 1985" took a westward track, devastated the Lynchburg area. The path of the eye never touched Virginia.

1989 - Hugo devastates South Carolina, but drops only 1.35" on Blackstone.
1996 - Fran (9/7) produced 4.61".

1999 - Dennis (9/4) and Floyd (9/16) team up to cause flooding that devastated Franklin. Dennis produced 4.47", Floyd added 6.13" in the Blackstone area.

## Average Snowfall for Selected Virginia Stations
