The experimental design was a randomized complete block design with three replications per site. Outliers were identified as any data point which exceeded 1.5 times the interquartile range and were removed from the analysis. Due to the number of entries, varieties were separated and tested by relative maturity group categories. To facilitate field operations and to allow for more accurate comparison, maturity group IV and V varieties were separated into early (RM 4.0-4.6; 5.0- 5.4) and late (RM 4.7-4.9; 5.5-5.9) relative maturity tests. Data were subjected to analysis of variance and means were separated with Fisher's Protected LSD test ($P = 0.05$).

The full test did not fit in one continuous field, so the maturity group 3's were planted in a different field. The field with the maturity group 4's and 5's had heavy slug pressure, in a no-till and cover crop residue situation. The plant stand suffered severe losses because of this, and the field was tilled and replanted with the same maturity group 4's and 5's on June 19, 2024.

Preliminary performance of full-season maturity group 3 entries at Eastern Shore, VA planted in **May** in a no-till field.
